Crop Health Analysis Report

Analysis reference: 1a2b3c4d-5e6f-7a8b-9c0d-112233445566

Status: Stressed	**Confidence:** 82%	**Severity:** Moderate

Capture Context

Captured: 2026-07-14T09:30:00+01:00

Location: Blida, Algeria

Weather on capture date

2026-07-14: 31.4°C avg, 22–38°C range, 41% humidity, 0.0 mm rain, 18 km/h wind

Annotated Image

Summary

The canopy shows localized stress consistent with early water deficit in the lower-right section, while the upper-left foliage remains healthy.

Detailed Findings

One healthy region and one stressed region were detected.

The stressed area exhibits leaf curling and mild chlorosis typical of water stress.

No signs of pest damage or fungal lesions were visible in the imagery.

Recommendations

- Increase irrigation in the lower-right zone over the next 3 days.
- Re-scan the field in 5-7 days to confirm recovery.
- Inspect soil moisture at 15 cm depth to rule out drainage issues.

Verdict based on drone imagery only; ground-truthing recommended before large-scale intervention.

Raw Detections

#	Class	Confidence
1	healthy	88.0%
2	stressed	76.0%
